

How a cancer-vaccine paper becomes database-ready data

A reading assistant copies what each study reports — it never invents — and a person signs off before anything counts.

What this guarantees

Nothing is invented

If the paper does not say it, the field stays blank — no guessing, no rounding-up.

Fully traceable

Every value can be traced straight back to its quote, table cell, or figure panel.

Uncertainty is visible

Anything read off a figure or not clearly stated is flagged for review — never hidden.

A human decides

A reviewer signs off before any record counts. The AI proposes; a person disposes.

The assistant reads and copies under strict rules; it does not diagnose, recommend, or draw conclusions. It turns a paper into a checkable table — a person verifies it.

Worked example · Rojas et al. — personalized mRNA vaccine in pancreatic cancer

16

patients

232

vaccine peptides

464

immune targets

30

measured responses

6

survival outcomes

Each one checked, cell-by-cell, against the paper's own data table.

Pending a curator's final sign-off — the same human-review step every record passes through.
